

# Introduction to Space Weather

Antti Pulkkinen, NASA GSFC

# Preamble

- No single textbook that covers all of space weather.
- Recommended reads:
  - Koskinen, H., Physics of Space Storms: From the Solar Surface to the Earth, Springer, 419 p., 2011. (Available at Amazon and as an online textbook via SpringerLink.com, which can be accessed at NASA GSFC)
  - Daglis, I.A. (editor), Space Storms and Space Weather Hazards, Nato Science Series II, Vol. 38, 2001.
  - Song, P., H. J. Singer, and G. L. Siscoe (eds.), Space Weather, AGU Geophysical Monograph Series, Vol. 125, 2001.

# Preamble

- Recommended reads cont'd:
  - Kivelson, M. G., and Russell (eds.), C. T., Introduction to Space Physics, Cambridge University Press, 1995.
  - Parks, G. K., Physics of Space Plasmas. An Introduction, Westview Press, 2004.
  - Bothmer, V. and I. Daglis, Space Weather: Physics and Effects, Springer, 438 p., 2007. (Available as an online textbook via SpringerLink.com, which can be accessed at NASA GSFC).

# Preamble

- Recommended reads cont'd:
  - Carlowicz, M.J., R.E. Lopez, *Storms from the sun: the emerging science of space weather*, Joseph Henry Press, 2002. (lighter read)
  - Clark, S., *The Sun Kings: The Unexpected Tragedy of Richard Carrington and the Tale of How Modern Astronomy Began*, Princeton University Press, 2007. (lighter read)

# Preamble

  - CUA Space Weather Academy: [www.youtube.com/user/CUASpaceWeather](http://www.youtube.com/user/CUASpaceWeather).
  - CCMC REDI: <http://ccmc.gsfc.nasa.gov/support/SWREDI/swredi.php>.
  - NOAA SWPC: [www.swpc.noaa.gov](http://www.swpc.noaa.gov).

So let's get going!

# Introduction to Space Weather

- Basic physical concepts. Sun, solar wind, eruptive solar phenomena, magnetosphere, ionosphere, geomagnetic induction.
- Impacts. Technological systems in the space and on the ground, humans in space and high altitudes.

# Introduction to Space Weather

“Space weather refers to conditions on the Sun and in the solar wind, magnetosphere, ionosphere, and thermosphere that can influence the performance and reliability of space-borne and ground-based technological systems and can endanger human health. Adverse conditions in the space environment can cause disruption of satellite operations, communications, navigation, and electric power distribution grids, leading to a variety of socioeconomic losses.”

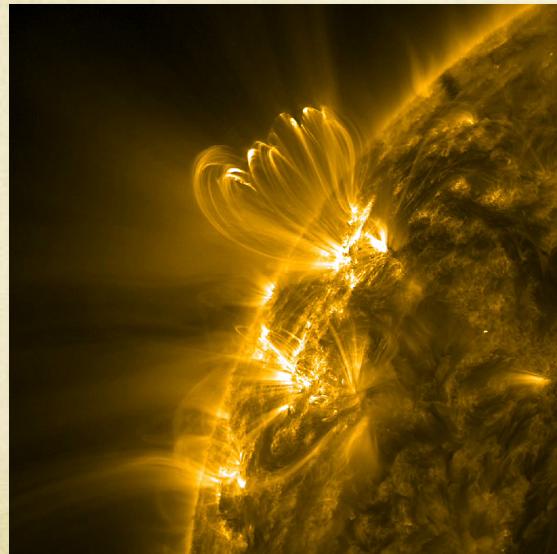

US National Space Weather Program

# Introduction to Space Weather

- The physics of space weather is *plasma physics*.

*“Plasma is quasi-neutral ionized gas containing enough free charges to make collective electromagnetic effects important for its physical behavior”*

# Introduction to Space Weather

- The range of space weather scales is extremely challenging.
  - Relevant time scales vary from  $\approx 10^{-9}$  s (plasma fluctuations in the solar atmosphere) to  $\approx 10^8$  s (solar cycle).
  - Relevant spatial scales vary from  $\approx 1$  m (ionospheric plasma structures) to  $\approx 10^8$  m (large-scale interplanetary plasma structures).
- Further there is a strong coupling across the scales.

→ Forecasting space weather is a serious challenge...

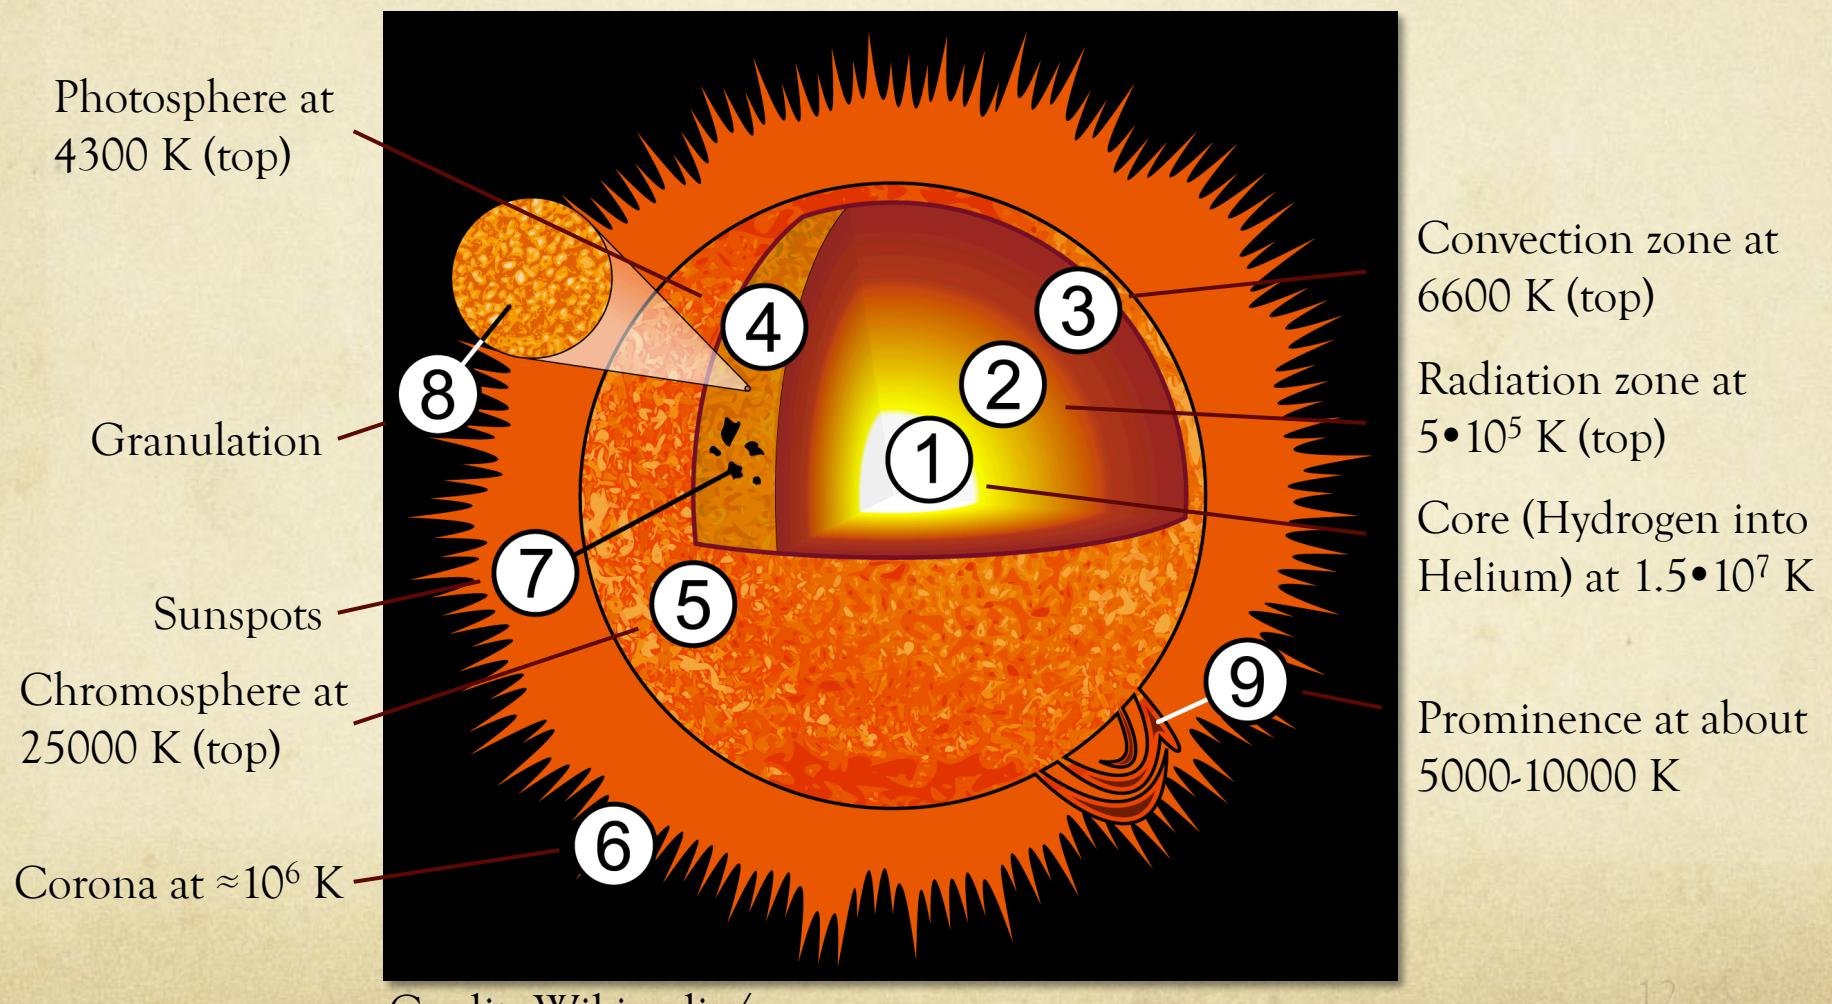

# Introduction to Space Weather

- Although internal magnetospheric dynamics and galactic sources play an important role as well, the Sun is the ultimate source of (almost) all space weather.
- Consequently, lets start our run through space weather domains from the Sun.

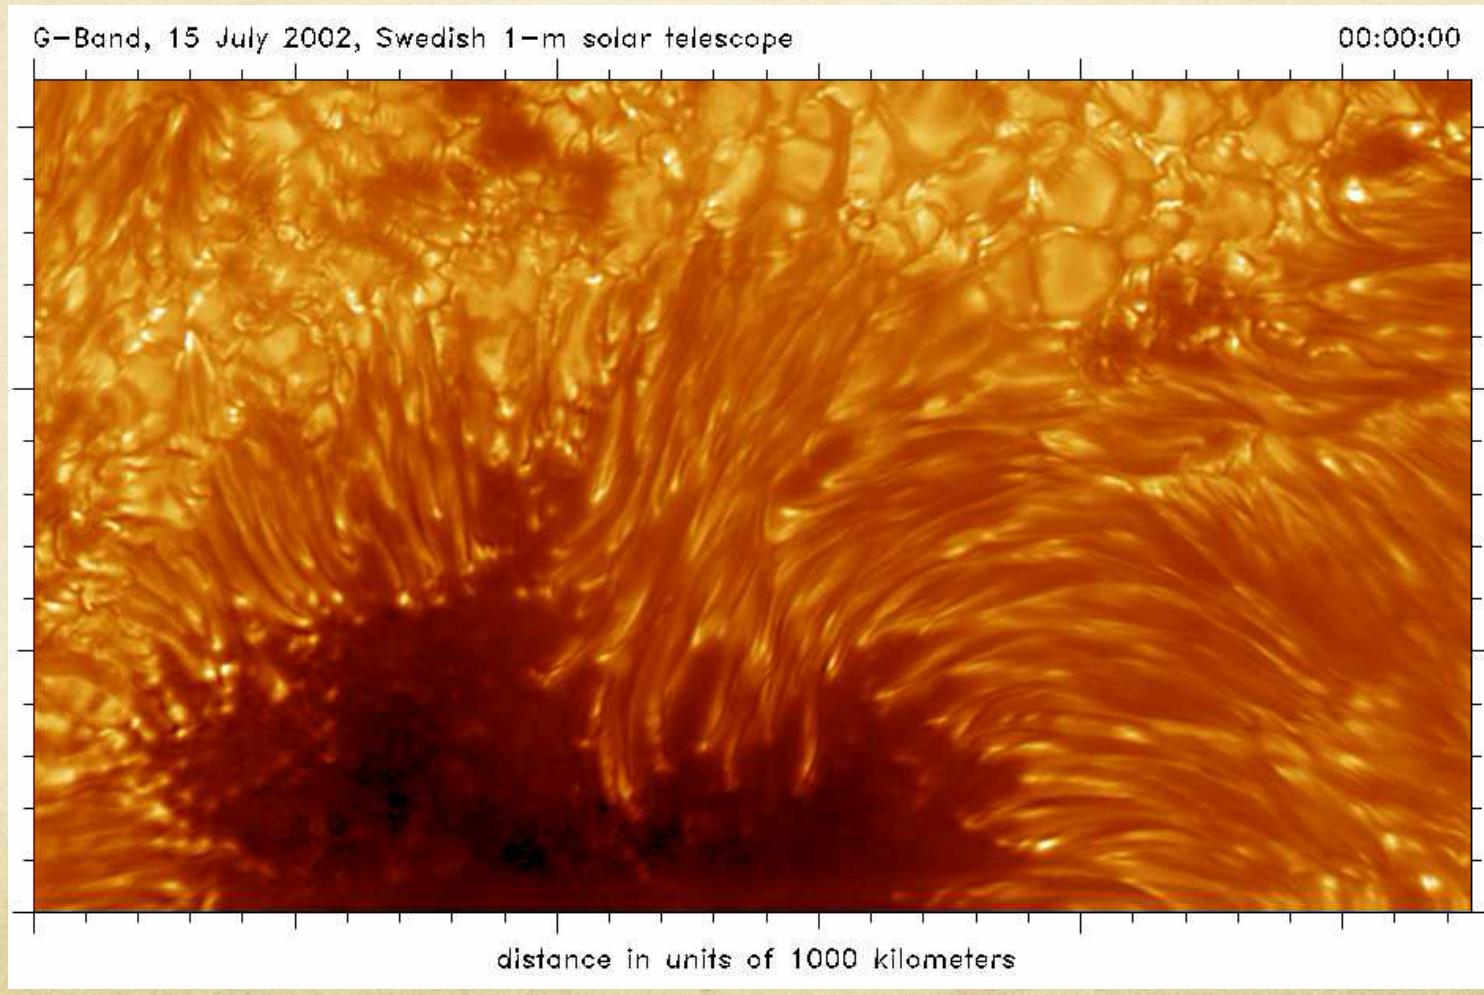

# Introduction to Space Weather

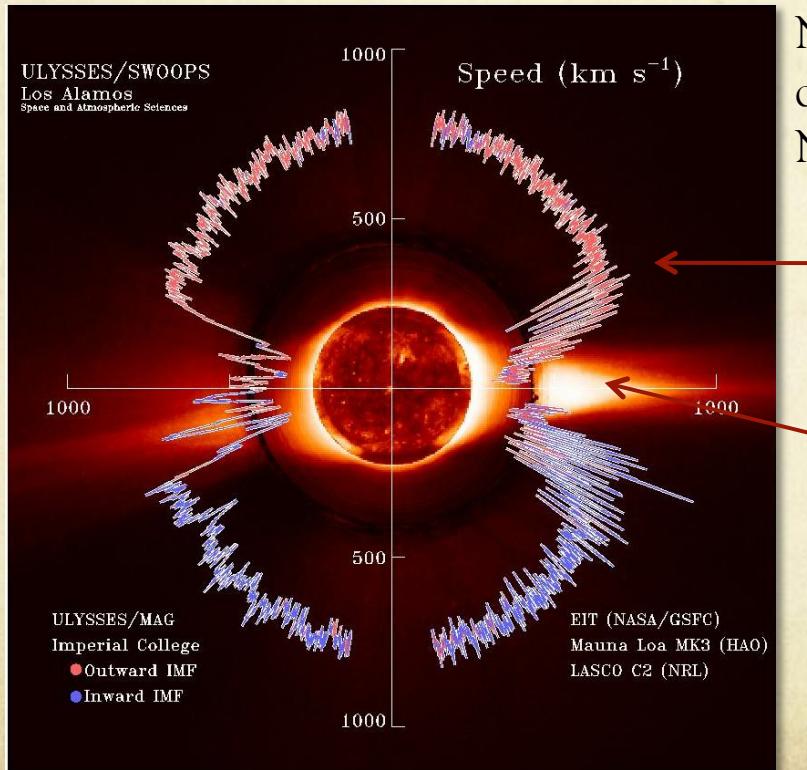

# Introduction to Space Weather

# Introduction to Space Weather

- Solar atmospheric mass, momentum and energy are being carried away by *solar wind*.

coronal hole(s)

Denser low speed wind  
from lower latitudes

# Introduction to Space Weather

- The Sun is a magnetic beast. The magnetic field generated through *dynamo process*. both convection zone *turbulence* and *solar differential rotation* play important roles.

Increasing sunspot number indicates more complex global solar magnetic field structure → eruptions more likely

# Introduction to Space Weather

- As the global solar magnetic field structure gets more complicated also plasma configurations in the solar corona gain complexity.

# Quick quiz

- How do you think Space Age has changed our capacity to observe space weather?

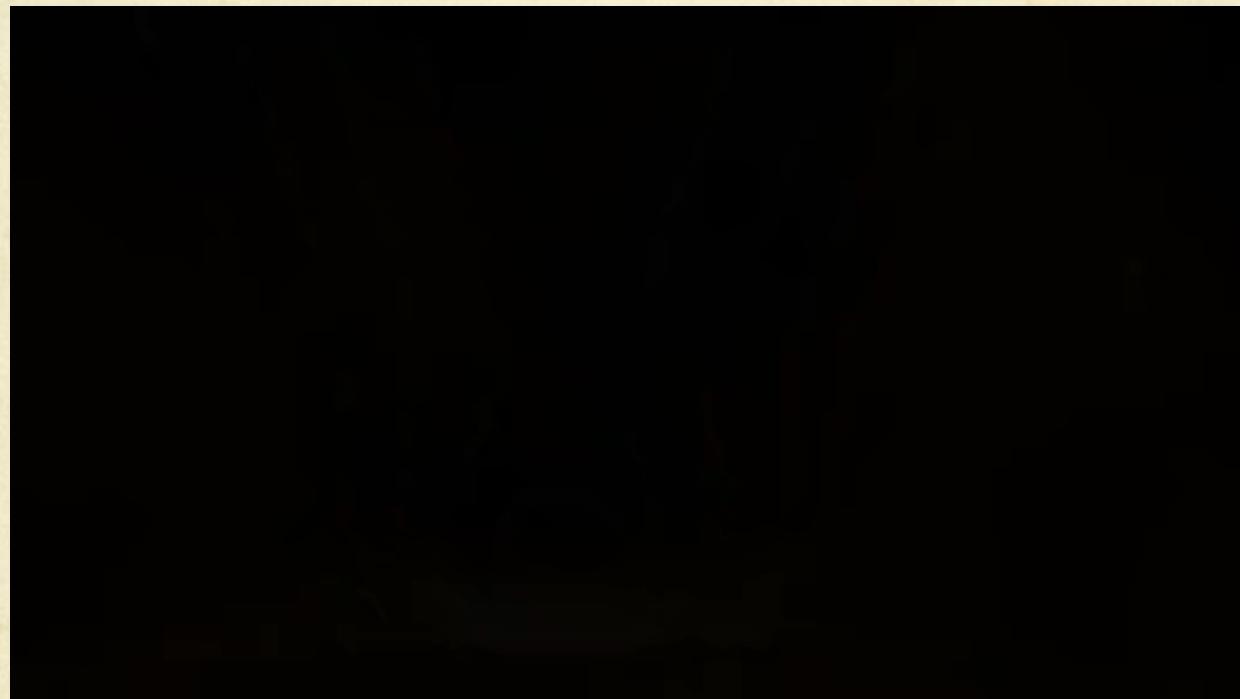

# Introduction to Space Weather

- The build up of complexity in the corona is associated with build up of *free energy* in plasma configurations.
- A variety of *plasma instabilities* such as flux tube instabilities are important for relaxation of plasma configurations in the solar corona.
- However, we believe that *magnetic reconnection* plays the key role in converting the (magnetic) free energy into thermal and kinetic energy (plus electromagnetic radiation) of the transients.

# Introduction to Space Weather

- Solar flares lasting, depending on the signature of interest, 1-60 min are the largest eruptions in the solar system. Energy of the order of  $10^{25}$  J can be released by flares (annual world energy consumption  $\approx 10^{20}$  J).

SVS

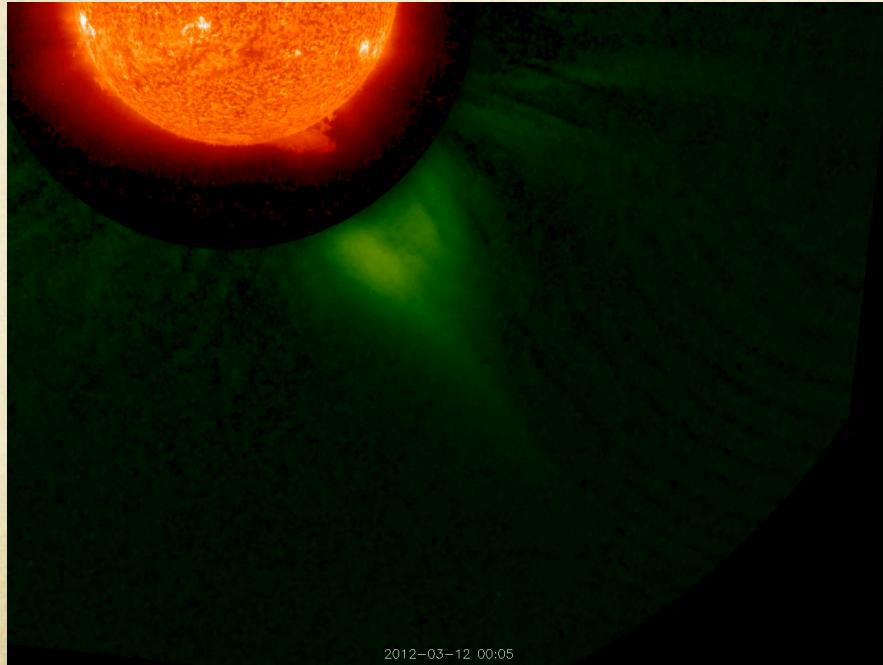

# Introduction to Space Weather

- Generally speaking in solar flares free magnetic energy converted into heat, non-thermal particle acceleration and electromagnetic radiation.
- Solar flares generate, for example, X-ray, Extreme Ultraviolet (EUV) and radio emissions, and solar energetic particles (SEPs).
- All of the above have significant space weather consequences.

# Introduction to Space Weather

- Many large flares are associated with *coronal mass ejections* (CMEs) releasing billions of tons of solar corona material at speeds of 200-3000 km/s. Total kinetic energy of CMEs can be of the order of  $10^{25}$  J.

# Introduction to Space Weather

- CME eruptions drive shock waves that also accelerate charged particles. These particles generate the second (and often more significant) SEP component.
- CME propagation to the Earth takes typically 1-3 days.

# Introduction to Space Weather

- Also low flux but very energetic *galactic cosmic rays* (GCRs) coming from galactic sources contribute to charged particle radiation in the solar system.

# Introduction to Space Weather

- Charged particles flowing from the Sun interact with the Earth's plasma environment called *magnetosphere*. Magnetic reconnection “opens up” magnetosphere to allow entry of mass, momentum and energy.

SVS

# Introduction to Space Weather

- The entry of mass, momentum and energy powers very complex dynamic phenomena in the magnetosphere. Radiation belts are one central part of these phenomena.

Energetic (100 keV-10 MeV) electrons in the radiation belts

SVS

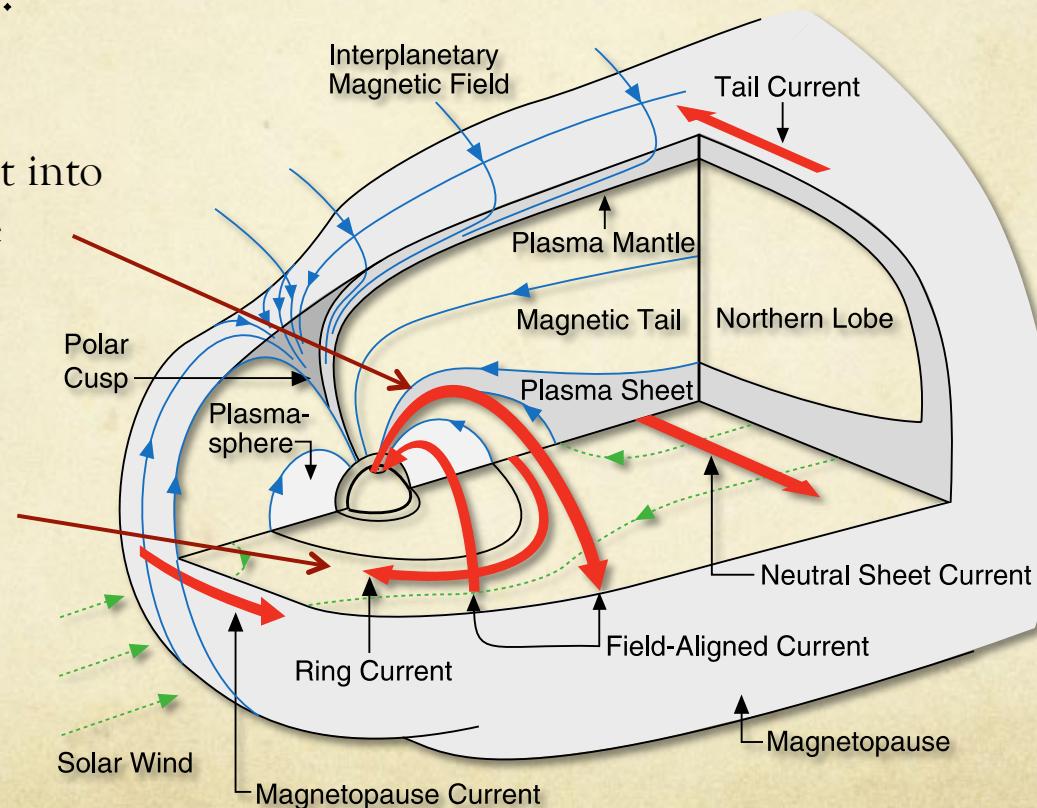

# Introduction to Space Weather

- Also various magnetospheric electric current systems get powered.

$\approx 1 \text{ MA}$  current into the ionosphere

Charged (10-200 keV) particles carrying the ring current partly overlap with the radiation belts

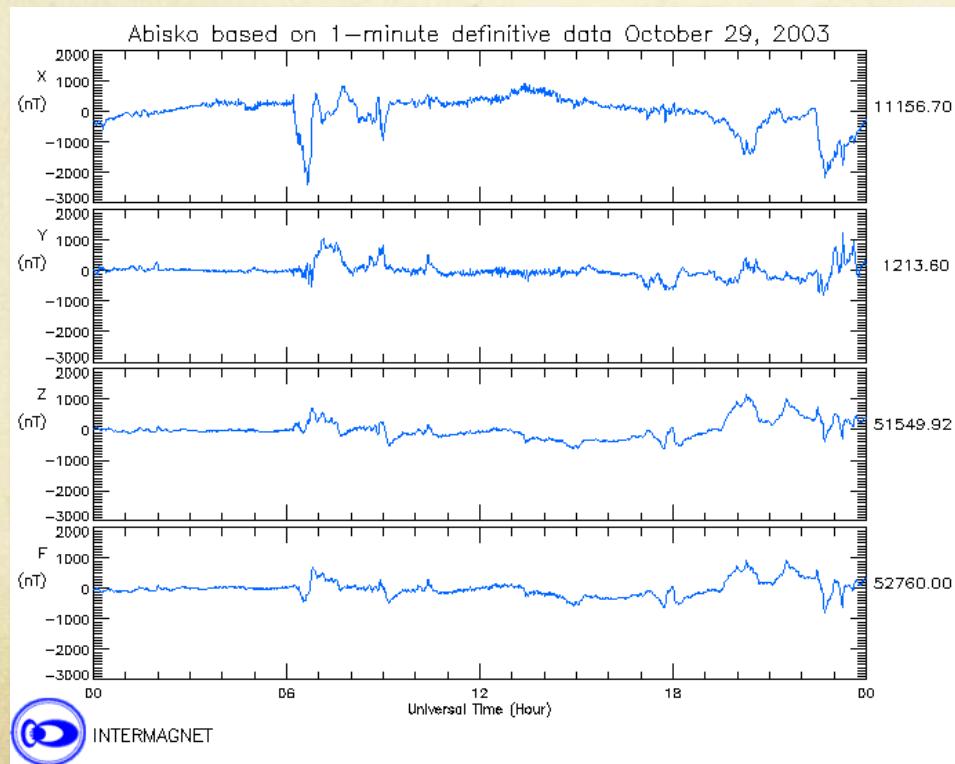

Credit: Russell, C. (IEEE Trans. on Plasma Science, 2000)

# Introduction to Space Weather

- Electric currents flowing in the near-space generate magnetic field perturbations on the surface of the Earth. These fluctuations are called *geomagnetic storms*.

Storm-time magnetic field variations observed in a high-latitude station.

# Introduction to Space Weather

- Earth's ionized upper atmosphere (80-1000 km altitude) reacts for example to solar flare-related X-rays, EUV, SEP events and magnetospheric activity.

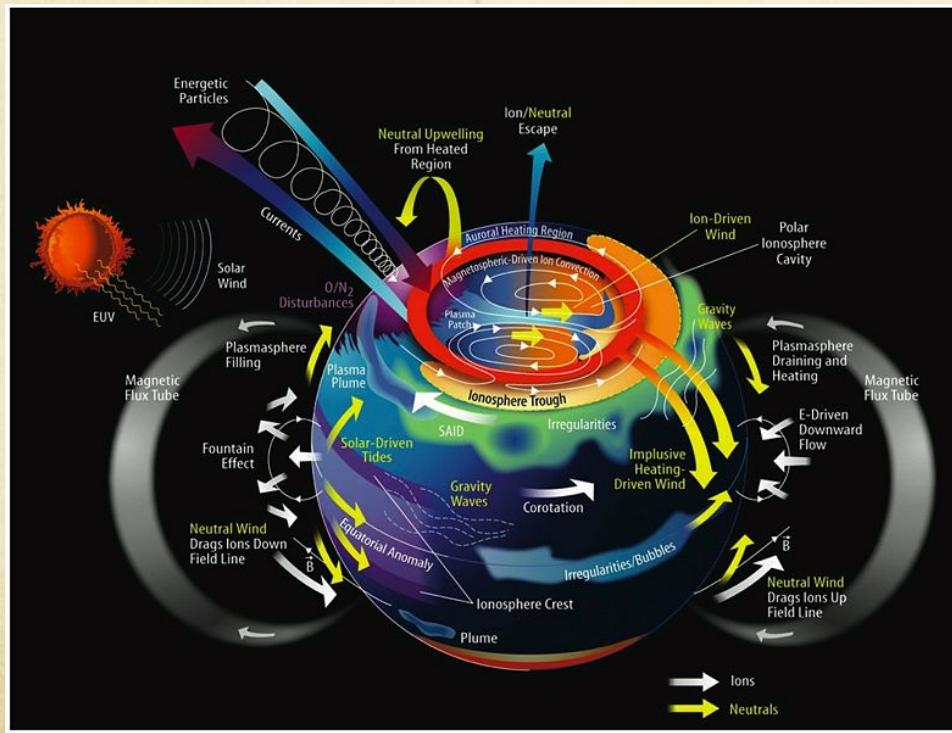

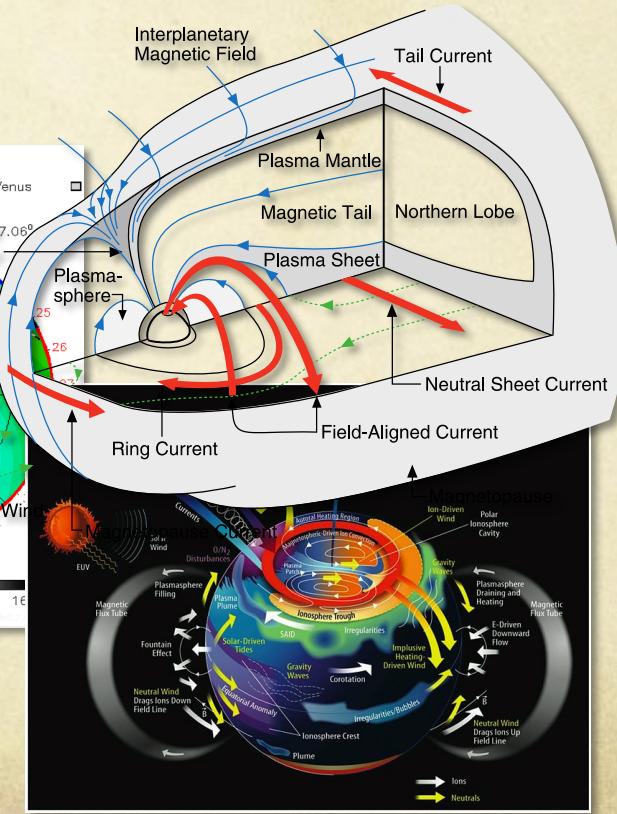

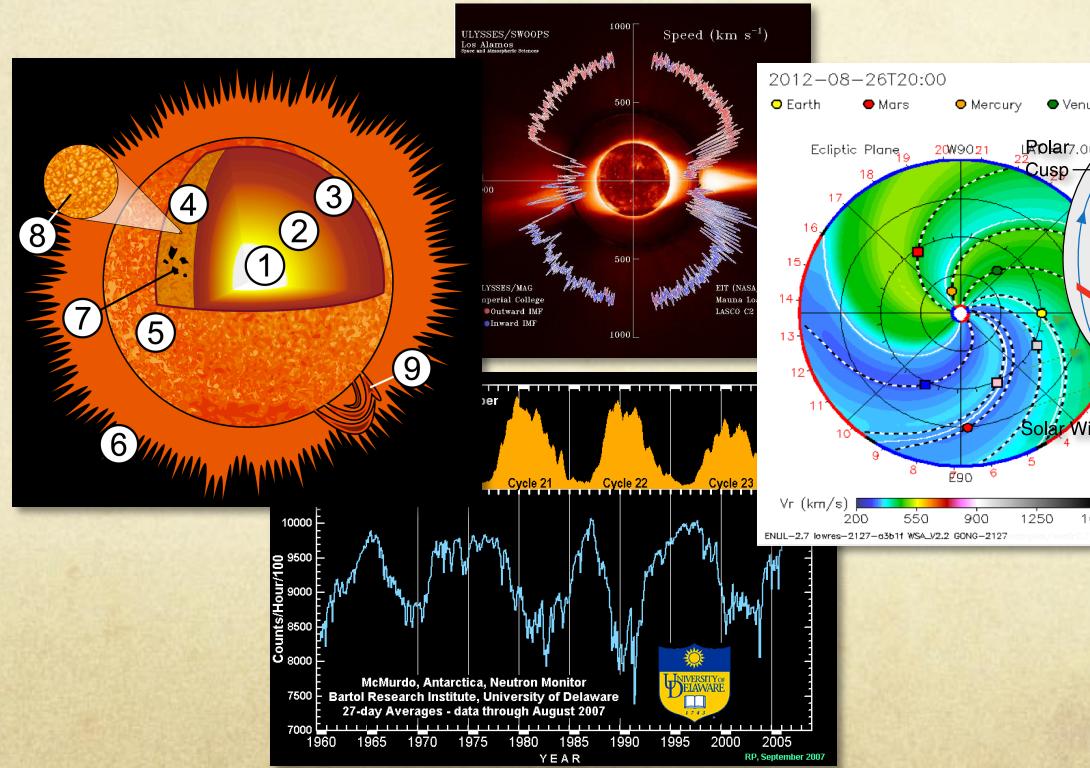

Illustration of upper atmospheric dynamics.

# Introduction to Space Weather

- So we see that space weather really is a vast chain of complex interacting systems covering wide ranges of physics and spatiotemporal scales.

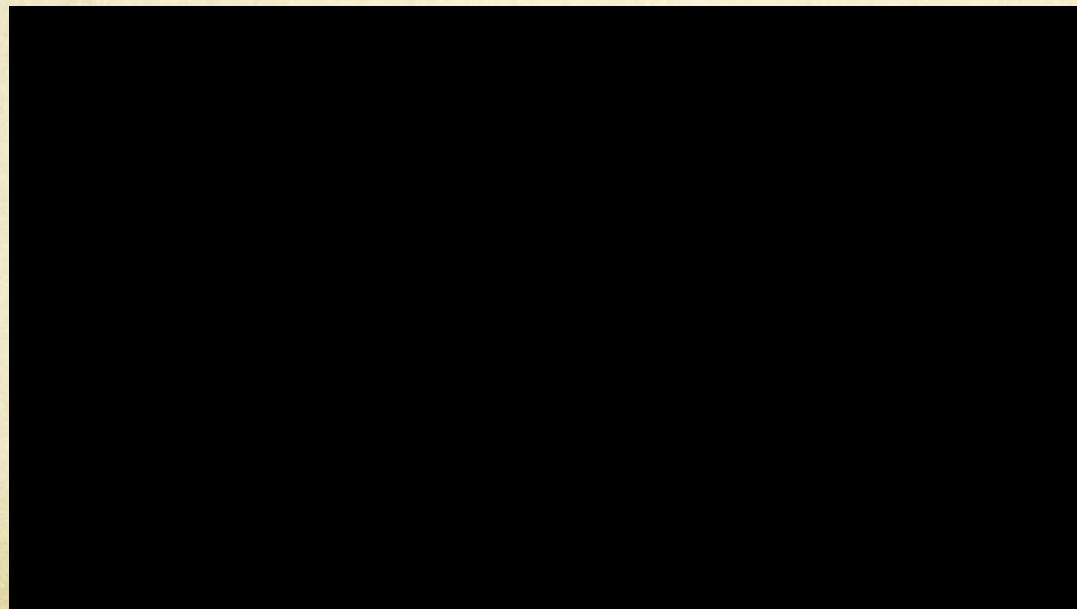

# Quick quiz

- What do you think are some of the major similarities and differences between space weather and “regular” weather?

# Introduction to Space Weather

- Let us then very briefly review the *impacts* side of space weather. Perhaps the best known and positive “entertainment aspect” of space weather are the northern (and southern) lights.

# Introduction to Space Weather

We will not be discussing these

Space weather impacts (credit: L. Lanzerotti/Bell Labs)

# Introduction to Space Weather

- Spacecraft can be impacted in a number of different ways depending on the orbit of the vehicle.
  - Surface (auroral and ring current electrons) and deep internal charging (radiation belt electrons).
  - Single event upsets (GCRs, SEPs, inner radiation belt protons).
  - Drag effects (upper atmospheric expansion).
  - Total dose effect (cumulative radiation in any environment).
  - Effects on the attitude control systems (magnetic field fluctuations and SEPs).

Solar Dynamics Observatory  
(credit: NASA)

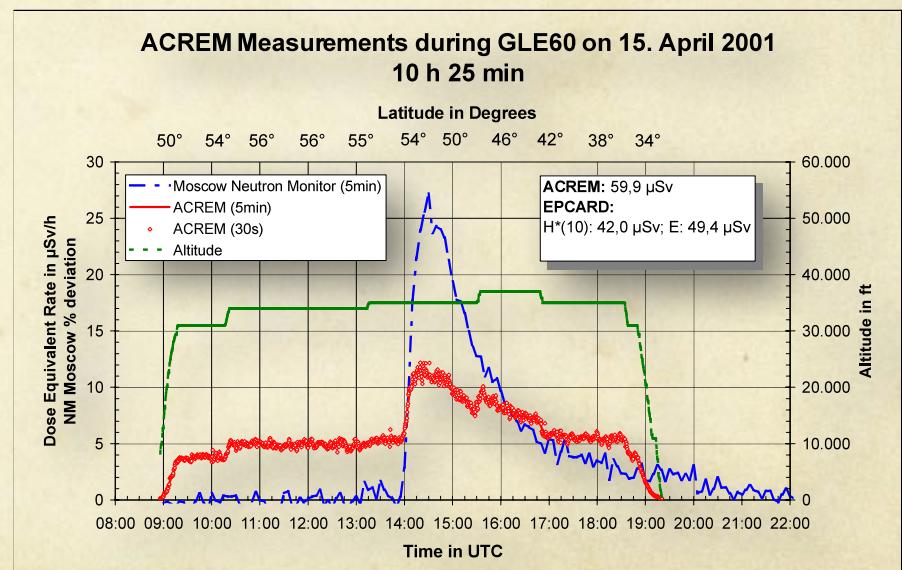

# Introduction to Space Weather

- Energetic charged particle radiation is a hazard for humans in space and at airline altitudes. Especially less predictable SEPs are a concern.

Credit: NASA

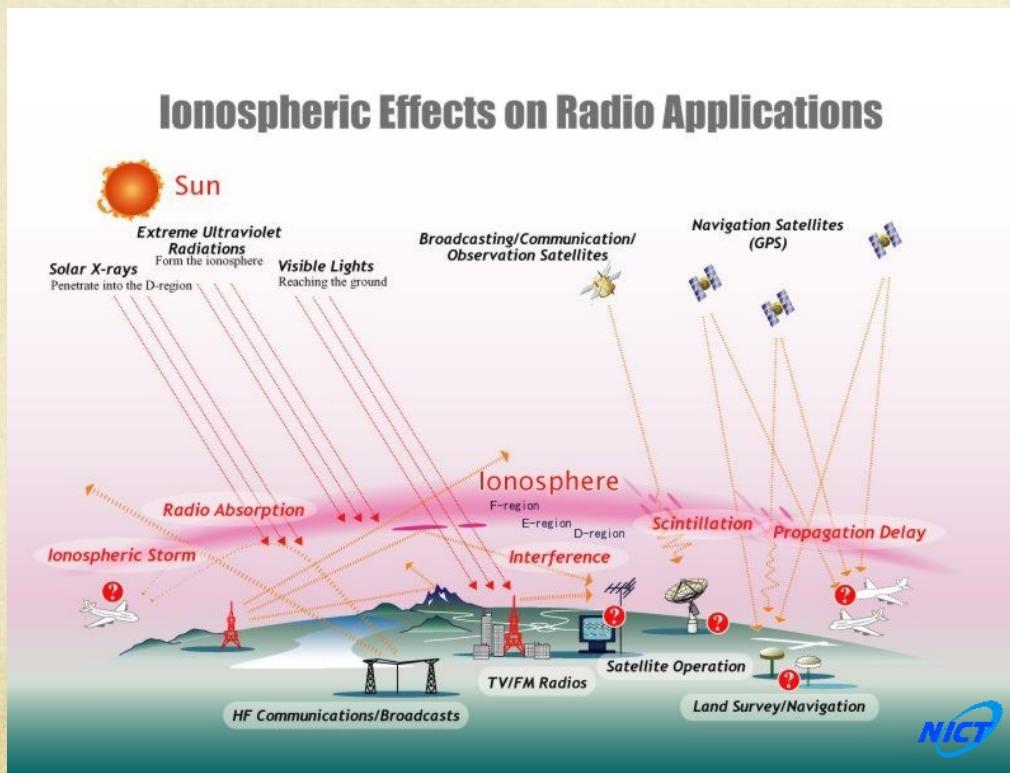

## Dose observations from a commercial flight (Credit: Bartlett et al., 2002)

# Introduction to Space Weather

- Signals using ionosphere or “just” passing through ionosphere are affected by space weather.

Credit: NICT

- Global navigation satellite systems such as GPS (e.g., EUV, X-rays, SEPs, magnetospheric activity)
- High-frequency (HF) radio communications (e.g., EUV, X-rays, SEPs, magnetospheric activity)
- Other GHz range comms such as cell phones (solar radio noise)

# Introduction to Space Weather

- Geomagnetic field fluctuations drive geomagnetically induced currents (GIC) that can be a hazard to long conductor systems on the ground.

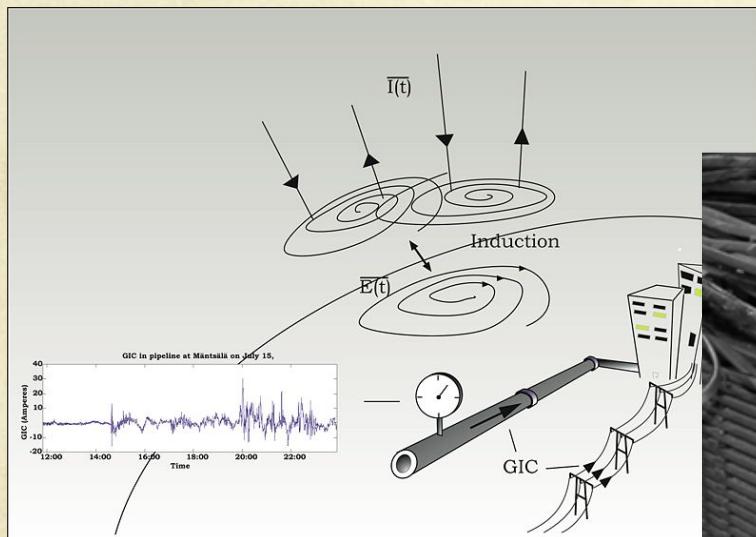

Illustration of mechanism for generating GIC

Transformer damage in South Africa
